SUMMARY

For the last two decades the European Commission has engaged in a major effort to liberalize network industries. While network industries had, for often over a century, been controlled by (State) monopolies, it was believed that the opening of the network industries markets to competition would bring significant consumer benefits and enhance the competitiveness of the European Union. This effort essentially relied on three pillars. First, liberalization directives had to remove the exclusive rights, which were granted to incumbents. Second, these directives provide for the development of regulatory frameworks designed to create facilitate the arrival of competition, as well as the setting up regulatory authorities in charge of implementing such frameworks. Finally, the application of EC competition rules has played a significant contribution to the promotion of competition in network industries. The liberalization effort pursued by the Commission is generally considered as a success. Today, two sectors (air transport and electronic communications) are completely open to competition, while liberalization is well engaged in the other sectors (postal services, energy, and rail transport). Some bottlenecks, however, remain and impede competition in a number of sectors. First, a serious problem comes from the inadequate implementation of liberalization directives in some of the Member States. This delays the liberalization process and creates distortion of competition by creating regulatory asymmetries between Member States. Second, the absence of EU-wide regulatory authorities negatively affects the creation of truly integrated markets as national authorities are poorly adapted to deal with cross-border issues as their scope of action is typically limited to their Member State borders. Third, the arrival of competition in network industries markets is often impeded by the fact incumbents tend to rely on their market power to prevent entry on the market. Finally, the creation of EU-wide markets in network industries is negatively affected by various forms of economic patriotism whereby Member States try to protect their incumbents. A hotly-debated issue is whether, as competition progressively arrives on a variety of markets, sector-specific regulation will be rolled-back, thereby leaving competition rules as the only instrument to control market power in network industries. It is argued that while a deregulatory movement is already observed in a number of sectors, some degree of sector-specific regulation is probably there to stay for two reasons. First, some network infrastructures (such as, for instance, electricity transport systems) hold natural monopolies features and thus need continued regulation. Second, because competitive markets are unlikely to provide for universal service, universal service obligations will need to be maintained.
1 INTRODUCTION

Over the last twenty years, governments in many parts of the world have engaged in the liberalization of network industries (telecommunications, postal services, energy, and transport). This liberalization process, which was first observed in the United States in the late 1970s and in the United Kingdom in the early 1980s, became a central preoccupation of the European Commission at the end of the 1980s. Since then, the European Commission has initiated liberalization reforms in a range of sectors with some success. Sectors, such as telecommunications and air transport, are now fully liberalized and are becoming increasingly competitive. Others sectors, such as energy (gas and electricity), postal services, and rail transport, are not yet fully liberalized, but the market opening dynamic is now well under way. The liberalization process has not been without difficulties, however, and many challenges still lie ahead. Against this background, the objective of this paper is to give a brief overview of the liberalization process and the results it has achieved, as well as to address some of the main challenges that still lie ahead.

This paper is organized as follows. Part II explains why for almost a century firms involved in network industries were generally taking the form of State monopolies, as well as why this model of organization has been subject to question in the late 1970s and thus progressively replaced by a model based on market opening and competition. Part III explains that to be successfully completed the liberalization process should rely on three pillars: the removal of exclusive rights, the adoption of a regulatory framework and the setting-up of independent regulatory authorities. Part IV analyses the current state of liberalization in the different network industries. Part V reviews the various bottlenecks, which still prevent competition to take place on some markets. Part VI discusses the issue of whether one should be able to do away with sector-specific regulation at one stage. Finally, Part VII contains a short conclusion and some proposals for moving ahead.

2 THE TRANSITION FROM PUBLIC MONOPOLIES TO COMPETITIVE MARKETS

For almost a century, network industries were organized as State monopolies. There were several reasons for this.

First, there was a belief that such industries were natural monopolies, i.e. that there was only space for one undertaking in the market. This view was based on the observation that sectors, such as telecommunications and energy, were subject to large economies of scale and that network infrastructures were very hard or even perhaps impossible to duplicate. Exclusive rights thus legally translated the perceived economic model governing network industries.

Second, monopolies were often granted in return for the monopolist to provide universal service, also often referred to as “public services” or “services of general economic interest”. There was thus a kind of “regulatory contract” between governments and large utilities. The latter would provide their services throughout the territory (including loss-making areas), to all customers (including unprofitable ones), with a given level of quality and without discontinuity, thereby ensuring social and geographic cohesion. The provision of universal service would certainly have a cost, but the monopoly granted to these firms would allow them to cross-subsidize profitable services with loss-making ones and still make a profit.

Third, because of the importance of these industries from several viewpoints governments believed it was important to consolidate them in one firm, which they controlled. Network industries were indeed of central importance at several different levels: (i) strategic (need to control basic infrastructures in case of war or major crisis); (ii) economic (these industries employ millions of workers and represent a significant part of the GDP); and (iii) political (State monopolies were often part of the administration or had closed links with public authorities).

In the late 1970s, however, the basic tenets of the monopoly model started to be challenged by economists, lawyers, policy-makers, industrialists and consumer organizations.

First, economists started to argue that, while some market segments in network industries (e.g., the local loop in telecommunications and electricity transport network) certainly have natural monopoly features, others were contestable. For instance, while the local loop (the “last mile” of copper wires) could hardly be duplicated by new telecommunications entrants and would thus, at least for some years, remain monopolized by the incumbent, a number of other market segments, such as the provision of services were potentially competitive. Such

---

segments should thus be freed of exclusive rights to allow competition to take place.

Similarly, the provision of universal service did not necessarily require the maintenance of public monopolies cross-subsidizing unprofitable market segments with profitable ones. Cross-subsidization was an imprecise funding mechanism, which is also distorted competition. Other methods of financing, such as for instance targeted subsidies from general taxation or the creation of compensation funds could be used to contribute to the (often exaggerated) costs of providing universal service.6

Second, industry organizations in sectors subject to fierce international competition, such as the production of steel or the manufacturing of automotive vehicles, argued that they were largely penalized by the high costs of essential production inputs (electricity, gas, transport, etc.), which were provided by public monopolies. If these sectors were to remain competitive in the face of the globalisation of the economy, network industries had to be liberalized as competition would bring lower prices and better quality of service.

Third, consumer organizations also started to complain about the poor performance of public monopolies. Consumer prices tended to be high and the quality of service poor. The absence of competition, and thus of alternatives for consumers, gave public monopolies few incentives to adopt consumer-friendly policies and provide innovative products and services. Aligned with industry organizations, they claimed that competition was the best way to induce better prices, improve quality of service, and stimulate innovation.

Fourth, early experiences of liberalization in the United States and the United Kingdom convinced European authorities that the liberalization model was workable and could provide positive economic results. A new model, based on the opening of network industries to competition, combined with regulation through independent agencies, offered an interesting alternative to the much criticized and loss-making monopolies created at the turn of the 20th century.

Finally, the European Commission realized that public monopolies, which were based on the granting of exclusive rights to national undertakings, were fundamentally at odds with its internal market policy. National monopolies prevented other Member States’ operators from competing thereby impeding the free movement of goods and services. In other words, the granting of

---

6 Regarding the methods which can be used to fund universal postal service, see the WIK Consult to the European Commission, Main Developments in the Postal Sector (2004-2006), at p. 78.
exclusive rights had the effect of partitioning the common market in contradiction with the basic principles of the EC Treaty.  

In the mid-1980s, the European Commission took a number of policy initiatives, such as the publication of green papers, leading to the adoption of proposals for directives liberalizing the various network industries. While in the area of telecommunications, the Commission managed to achieve quick results through its reliance on directives based on Article 86(3) of the EC Treaty, which provides the Commission with the power to adopt directives by itself, in other sectors, the Commission relied on the lengthy legislative process comprised in Article 95 EC (co-decision between the Council and the European Parliament). Directives in the energy and postal services sectors were thus the result of compromises between Member States and EU institutions, which were often short of the market opening ambitions of the Commission. Liberalization directives were indeed often met with skepticism on the part of certain Member States, such as for instance France or Belgium, which were keen to protect their public monopolies. Other Member States, such as the Netherlands or the United Kingdom, were by contrast in favor of rapid market opening. There was a tension between Member States over the necessity and the speed of the liberalization of network industries.

3 THE THREE PILLARS OF THE LIBERALIZATION PROCESS

The liberalization of network industries in the EU has relied on three pillars.

First, liberalization directives had to remove the exclusive rights, which were granted to certain companies. Removing such rights did not necessarily involve major legal complications, but, for reasons discussed above, often involved complex political compromises. One of the distinctive features of the liberalization process in the EU was that market opening was progressive. For instance, in the telecommunications sector, some services were open to

---

7 See § 5 of the preamble of Directive 90/388 of 28 June 1990 on Competition in the Markets for Telecommunications Services, O.J. 1990, L 192/10: “The granting of special or exclusive rights to one or more undertakings to operate the network derives from the discretionary power of the State. The granting by a Member State of such rights inevitably restricts the provision of such services by other undertakings to or from other Member States.”

competition before others\textsuperscript{11} and in the energy sector some clients were free to select the supplier of their choice before others.\textsuperscript{12} A reason for such a staged approach was to provide incumbents with some time to reorganize themselves and get ready for competition. Such an approach was useful to reach consensus between Member States, which, as noted above, did not necessarily agree on the need for liberalization and the pace at which it should be pursued.

Second, liberalization directives had to establish a regulatory framework. This framework contained not only substantive obligations, but also provided that Member States had to create independent regulatory authorities. The substantive obligations generally sought to maintain or expand universal service. Universal service is generally considered of central importance to the EU model and its survival had thus to be guaranteed in the new economic context created by liberalization.\textsuperscript{13} Such obligations were also designed to facilitate the creation of competition on the liberalized markets. It is not because exclusive rights are removed by legislation that such markets will necessarily become competitive. Incumbents typically retain important advantages, such as the control of essential infrastructures (networks), well-established brand names, superior technical expertise, large cash reserves, and special connections with their national government.\textsuperscript{14} Liberalization directives thus typically contain rules that ensure third-party access to the network, accounting separation and cost-allocation rules (to prevent cross-subsidization between competitive and non-competitive market segments).\textsuperscript{15} as well as rules designed to reduce switching

\textsuperscript{11} Compare Directive 90/388, supra note 6 with Directive 96/19 amending Directive 90/388/EEC with regard to the implementation of full competition in telecommunications markets, OJ L 74/13.

\textsuperscript{13} See Article 16 of the EC Treaty: "Without prejudice to Articles 73, 86 and 87, and given the place occupied by services of general economic interest in the shared values of the Union as well as their role in promoting social and territorial cohesion, the Community and the Member States, each within their respective powers and within the scope of application of this Treaty, shall take care that such services operate on the basis of principles and conditions which enable them to fulfil their missions."

costs (such as, for instance, number portability in telecommunications). Liberalization directives thus provide for pro-competition rules designed to create a level-playing field between incumbents and new entrants.

Besides such substantive rules, these directives typically contained provisions mandating Member States to create independent regulatory authorities.\(^{16}\) Under monopoly, the regulatory framework was generally limited to price control and quality of service regulation, which were often carried out by a ministerial department (for instance, the ministry of energy or telecommunications). But in a liberalized market, regulation is typically more important (because, as we have seen above, one needs to create a level playing field between the incumbents and new entrants) and to avoid conflict of interests should be carried out by an independent entity. These agencies have to be independent not only from the operators,\(^{17}\) but also from the government as the latter typically maintain holdings in the incumbents.\(^{18}\) A specific feature of the EU model is that regulation is carried out at the Member State level. Federal agencies, such as the FCC or the FERC in the United States, do not have an equivalent in the EU.\(^{19}\) At the time of liberalization, a limited number of independent authorities already existed in the Member States, such as for instance agencies in charge of controlling financial markets, but most Member States did not have agencies controlling network industries.\(^{20}\) Liberalization thus led to the creation of numerous new agencies in all Member States of the EU.

Third, liberalization requires the application of competition rules, which are to be used in support to the market opening process. Several categories of competition rules are important. Article 82 of the EC Treaty and equivalent national competition rules are often used to prevent incumbents from abusing their market power. Indeed, incumbents, which even after market opening typically remain dominant (at least for several years), often resort to a variety of

\(^{17}\) See ECJ, 13 December 1991, RTT vs. GB-Inno-BM, C-18/88, ECR 1991, p.I-5491 at §28: “Articles 3(f), 90 and 86 of the EC Treaty preclude a Member State from granting to the undertaking which operates the public telecommunications network the power to lay down standards for telephone equipment and to check that economic operators meet those standards when it is itself competing with those operators on the market for that equipment”.

\(^{18}\) Article 22 of Directive 97/67: “Each Member State shall designate one or more national regulatory authorities for the postal sector that are legally separate from and operationally independent of the postal operators. Member States shall inform the Commission which national regulatory authorities they have designated to carry out the tasks arising from this Directive.”

measures to prevent new entry. Such measures include refusal to access essential network infrastructures, anti-competitive cross-subsidization between competitive and non-competitive services, etc. Although ex ante regulation will often eliminate or at least reduce the risk of abusive behavior, ex post application of competition may be needed to redress such behavior when regulation has not proved sufficient. As competition progressively takes place on liberalized markets, Article 81 of the EC Treaty is also called to play an important role. Indeed, after a few years of tough competitive battles between incumbents and new entrants, these firms may decide to reduce the degree of competition through restrictive agreements, such as price-fixing or customer-sharing. Such initiatives must be fought as they eliminate the benefits of liberalization. The provisions of the EC Treaty prohibiting State aids (Article 87 et seq) also contribute to maintaining a level playing field in liberalized industries. Indeed, there might be a temptation for Member States to protect their incumbent against competition from new entrants by artificially increasing its competitiveness through various State aid measures. Finally, the EC Merger Control Regulation applies to all transactions meeting its thresholds. The liberalization process has indeed triggered many mergers (though, as indicated below, fewer than one may have expected in some sectors), which need to be analyzed to ensure that they will not impede competition in the market.

These three pillars are equally important. Removing exclusive rights without adopting a proper regulatory framework will not be sufficient as such a framework is necessary to control the incumbent’s market power and facilitate entry. The New Zealand experience, where the government had initially decided to liberalize the telecommunications market without adopting a proper regulatory framework only to realize later than liberalization was a failure and adopt such a framework, amply illustrates this point. Similarly, competition rules are needed even in the presence of ex ante regulation as such regulation will typically contain gaps and will not be sufficient to prevent certain anti-competitive behavior, such as for instance cartels or certain forms of State aid.

4 THE STATE OF PLAY

Twenty years after the first liberalization initiatives were taken by the European Commission, liberalization has made significant progress. The telecommunications (a term now replaced in the regulatory framework by the

---

21 See Geradin, supra note 1.
24 D. Geradin and M. Kerf, supra 21.
wider concept of "electronic communications") and the air transport sectors are fully liberalized and, with some exceptions, competitive. Price reductions and the development of new products and services have been spectacular and have transformed the outlook of these industries. Few would contest today that the liberalization of such sectors has generated substantial consumer benefits in terms of lower prices and wider access to services, although in some cases competition has created quality of service issues. It has also allowed numerous companies, most often with innovative business models (e.g., the low-cost airlines), to enter the telecommunications and air transport markets.

Liberalization is also well under way in the other network industries. In the energy sector, for instance, the electricity and natural gas markets will be entirely liberalized by 2007, thereby allowing all customers, including residential ones, to choose the supplier of their choice. Since 1 January 2006, the reserved area in postal services has been limited to 50 grams. Although it has not been formalized yet, 2009 is often mentioned as the likely date for full liberalization of the postal sector. As far as rail is concerned, the second legislative package adopted in 2004 provided for the opening of the market for international freight transport to the entire European rail network as of 1 January 2006 and the opening of the market for national freight transport as of

26 Council Regulation 2408/92 on access for Community Air Carriers to intra-Community air routes, (1992) O.J. L240/8
27 For instance, the benefits of liberalization in the field of electronic communications has been clearly illustrated by Commission Viviane Reding’s recent speech "The Review 2006 of EU Telecom rules: Strengthening Competition and Completing the Internal Market", Annual Meeting of BITKOM, Brussels, 27 June 2006, SPEECH/06/422 (“Between 1996 and 2002, EU telecommunications services grew much cheaper. On average, for the same telecoms services, consumers spent about 30% less of their income in 2002 than they did 1996. Competition among telecoms operators has in particular drastically cut the cost of making phone calls over the past 20 years. Since 2000 the EU weighted average charge of a 3 minute call has fallen by 65% and the cost of a 10 minute call by 74%. At the same time, the EU telecom rules have led to impressive investments in the electronic communications services both by the telecom incumbents and increasingly by new market entrants. Europe’s market for electronic communication services amounted to some 273 Billion Euro in 2005. Aggregate investment, measured in terms of capital expenditure, rose to more than 45 billion Euro in 2005, 6% more than in 2004. 2005 was thus the third consecutive of increased year-over-year investment levels. On average, around half of the turnover generated in the electronic communications markets in Europe comes today from new market entrants.”)
30 See WIK, supra note 5, at p. 29.
January 2007. In the third legislative package, the Commission also proposed that international passenger services be opened to competition in 2010.

Two important remarks should be made here.

First, while liberalization has been largely driven by European directives, the degree of market opening tends to vary, sometimes significantly, between Member States. This is due to several reasons. First, unless they provide for full market opening, EC liberalization directives will only set up minimum opening thresholds, which can be exceeded by governments. This explains why some Member States have gone faster than others in opening their market to competition. Second, even in the case of full liberalization, some Member States have dragged their feet in implementing liberalization directives. This has created a degree of asymmetry between Member States as, in practice, firms in some Member States managed to escape for several years the obligations imposed by EC law.

Second, it is interesting to note that while liberalization has been particularly fast in some sectors (air transport and telecommunications), it has been much slower in others. This is due to several factors. First, in the mid-1980s, there was a general belief that liberalization of the air transport and telecommunications sectors were really needed to stimulate the development of the internal market (this is particularly true for the air transport sector) and the competitiveness of the industry (this is particularly true for the telecommunications sector, which in Europe was lagging behind the United States). In contrast, the benefits of liberalization of sectors like energy, postal services, and rail were disputed. Energy is a highly strategic sector and, thus, several Member States, such as France, were reluctant to the market opening process and devoted significant efforts to delay it. While perhaps less strategic, postal services and rail are equally difficult sectors because of the anticipated

---

33 Several Member States, such as Estonia, Finland, Sweden, and the United Kingdom have, for instance, fully liberalized their postal market although EC law still allows Member States to maintain a reserved area. See Elizabeth Eaves, Opening the Mail, Wall Street Journal, 22 March 2006.

34 For instance, on 21 April 2004, after nine months of delay and two warnings, the Commission decided to take six Member States - Belgium, Germany, Greece, France, Luxembourg and the Netherlands - to the European Court of Justice for failing to implement fully new rules on electronics communications. See IP/04/510.
social costs in terms of employment losses, which full liberalization is anticipated to create.

5 CURRENT BOTTLENECKS

As we have seen in the preceding Part, liberalization is now complete in a number of sectors and well on its way in others. This does not mean, however, that all network industries markets are today competitive. The level of competition in the electricity and natural gas markets is, for instance, extremely small in a number of Member States despite the fact these markets are almost fully liberalized.\(^35\) There are indeed a number of significant bottlenecks, which still prevents competition to take place. These are discussed hereafter.

A. Poor transposition of EC directives

A first problem is the inadequate implementation of liberalization directives in some of the Member States. One advantage of relying on directives is that they give some degree of flexibility to the Member States.\(^36\) This may be important considering the different national situations in terms of market structures, administrative traditions, etc. The problem of this instrument is that directives have to be implemented by the Member States and some of them are dragging their feet to introduce EC provisions in their national legislation. This creates a degree of asymmetry in the level of regulation which applies to network industries in the different Member States, as well as distortions of competition. The tools at the disposition of the Commission to force Member States to implement directives are, however, quite ineffective. Legal actions against Member States for failure to implement directives typically take several years before the European Court of Justice (the “ECJ”) adopts a judgment.\(^37\) In the meantime, the regulatory asymmetry denounced above persists.

B. Lack of EU-wide regulatory authorities

As noted above, the EU system relies on the implementation of regulatory obligations through national agencies. The advantage of this approach is that

\(^{36}\) For a good discussion on the main features of directives, see Paul Craig and Grainne de Búrca, EU Law – Text, Cases and Materials, (2003) 3rd Ed., Oxford University Press, p.99. From a legal perspective the choice of a directive as a legislative instrument implies a division of competences between the EC and the MS. The EC institutions set the legislative goals to be achieved, while the MS are left free as to the form and method of achieving these goals.

\(^{37}\) According to the official statistics of the European Court of Justice, a judicial procedure lasts 20.2 months on average. See http://www.curia.europa.eu/fr/instit/presentationfr/rapport/stat/st04cr.pdf
national authorities are closer to the regulated firms than European agencies would be. This may contribute to improve the quality of regulation. On the other hand, there exists a degree of asymmetry between the levels of independence, competence, resources, and accountability of the national agencies. While some authorities, such as OFCOM or OFGEM in the United Kingdom, are well-resourced and independent, authorities in several Member States are still closely associated with their national government and their resources may be insufficient to adequately perform their missions. This may be another source of distortion in the internal market.

Of equal concern is the fact that national authorities seem poorly adapted to deal with cross-border issues as their scope of action is typically limited to their Member State borders.38 Yet, there are a certain number of regulatory issues of a cross-border nature, such as, for instance, the regulation of electricity flows across Member States. The lack of EU-wide regulatory authorities has been somehow compensated by various forms of cooperation between the Commission and the national regulatory agencies, but it is not clear that such cooperation is as effective as fully-fledged European agencies would be.39 There are, of course, European agencies in fields, such as air or rail transport, but these agencies’ competence is essentially limited to safety and inter-operability issues. In contrast, they are not competent with the complex economic regulation issues, which have been discussed above.40

---

38 This mismatch was recently acknowledged in a high-profile study (generally referred to as “the Sapir Report”) delivered by a group of distinguished scholars to the Commission. The report pointed out that “a policy may be inappropriately allocated between the EU and the MS levels with respect to the objective that is being pursued (either inappropriate centralisation or decentralisation)” and consequently raised the question whether “the current assignment of competences between the EC and the MS could be considered optimal”. See “An Agenda For a Growing Europe - Making the EU Economic System Deliver”, Report of an Independent High-Level Study Group established on the initiative of the President of the European Commission, July 2003, at p.88. This document is available at www.europa.eu.int/comm/dgs/policy_advisers/experts_group/ps2/odcs/agenda_en.pdf

C. Anti-competitive behavior on the part of the incumbents

The opening of the network industries’ markets to competition does not mean that such market will overnight become competitive. In fact, following liberalization, the incumbents typically retain very strong market positions and thus remain dominant for a number of years. For instance, although the UK telecommunications market was open to competition in the 1980s, BT still remains dominant in a variety of market segments. The same can be said about most incumbents in network industries.

Incumbents will often rely on their market power to prevent entry on the market. They can do that through a variety of practices, such as refusal to give access to essential network elements, abusive pricing practices (e.g., margin squeeze), anti-competitive cross-subsidization, etc. EU directives typically contain regulatory measures designed to prevent such abuses of market power, but the creativity of incumbents when it comes to protect their dominant position is such that these measures are often insufficient. This requires the intervention of the European Commission, the national competition authorities, and the national courts on the basis of competition rules. Over the last twenty years, competition authorities have sanctioned many incumbents for abuse of market power in all network industries sectors. Because EC competition rules give significant power of investigation and enforcement to the European Commission, these rules are the most powerful instrument at the disposal of the Commission to prevent abuses of market power.

42 For instance, on the 20 March 2001, the Commission issued a decision holding that Deutsche Post AG was using revenues from its profitable letter-post monopoly to finance a strategy of below-cost selling in parcel delivery services. The complainant UPS, alleged that without the cross-subsidies from the reserved area, Deutsche Post AG would not have been able to finance below-cost selling for any length of time. UPS therefore called on the Commission to prohibit Deutsche Post AG’s fidelity rebate scheme and policy of below-cost selling. UPS further requested the Commission to impose a structural separation of the reserved area and the parcel services open to competition. Case COMP/35.141, Deutsche Post AG, 2001 O.J. (L 125) 27.

D. Economic patriotism

One of the key objectives of the European Commission when it initiated the liberalization process was the creation of truly integrated EU markets. Yet, while liberalization has introduced a degree of competition within national markets, it has so far failed to create such EU-wide markets. There are a number of reasons for that. First, as noted above, regulation is essentially a national matter. This does not facilitate the operations of firms with European ambitions. Moreover, network infrastructures where usually conceived for national markets, not a European one. For instance, national rail infrastructures were often incompatible, thus preventing trains to travel across Member States. Interconnectors at national borders typically have insufficient capacity to allow significant electricity exchanges. The flow of goods and services is thus impeded by the lack of cross-border infrastructures. This is an area where most investments are needed.

An additional factor is that they are relatively few EU-wide operators in network industries. Airlines or rail companies are still largely national. The same can be said of telecommunications, energy and postal operators. Network industry sectors in Europe are thus composed of dozens of operators, some relatively small, and most of which operate in one Member State only. This contrast with the situation in the United States where with some exceptions network operators tend to be large and operate throughout the nation. The number of cross-border mergers in these sectors has remained relatively modest although things are progressively changing.

In recent months, however, one has observed a powerful movement in certain Member States for the protection of their national champions. One can cite, for example, the efforts of the:

- French government to merge Suez with GDF as a way to counter a bid by Enel on Suez;  
- Luxembourg, French, Spanish, and Belgian governments to block a hostile takeover of Mittal on Arcelor; 
- Spanish government to advance a merger between Endesa and Gas Natural to which it was favorable.

---

47 H-H. Härtel, supra note 44, at p.59.
• Polish government to prevent Unicredito to take over BHP, a large local bank, though its acquisition of HBV, a German bank controlling BHP.  

This has triggered strong reactions from certain Member States, opposed to this new form of protectionism, but also from the Commission, which considers that the above efforts could run counter internal market rules and competition rules. Economic patriotism is a serious issue because it is fundamentally at odds with the creation of EU-wide firms operating on an EU-wide market.

6 CAN WE DO AWAY WITH SECTOR-SPECIFIC REGULATION?

It is frequent to hear incumbents claiming that it is time for the progressive phasing out of sector-specific regulation. This claim is obviously motivated by the fact that regulation places restrictions on their behavior and generates implementation costs. Most experts agree that sector-specific regulation should in principle be transitory and that, as regulation is rolled-back, network industries should be increasingly controlled through general competition rules. On the other hand, new entrants are against this phasing out as they see themselves as somehow protected by these rules.

In the electronic telecommunications sector, the Commission has already engaged in a deregulatory process through its proposal for a new electronic communications regulatory framework, subsequently adopted by the Council of Ministers and the European Parliament. This framework is deregulatory in the sense that it requires that sector-specific regulatory requirements be only adopted or maintained provided that the market in question is identified as non-competitive due to the presence of a dominant firm. This means that, as markets become increasingly competitive, sector-specific rules should

---

51 The new regulatory framework for electronic communications does provide for a review system whereby regulatory requirements can only be imposed or maintained on operators holding significant market power as long as they are necessary to correct a market failure. See recital 27 of the preamble of the Framework Directive: “It is essential that ex ante regulatory obligations should only be imposed where there is not effective competition, i.e. in markets where there are one or more undertakings with significant market power, and where national and Community competition law remedies are not sufficient to address the problem”. See D. Geradin and G. Sidak, “European and American Approaches to Antitrust Remedies in the Regulation of Telecommunications”, in S. Majumdar, I. Vogelsang and M. Cave, eds., Handbook of Telecommunications Economics, Vol.II: Technology Evolution and the Internet, North-Holland,2004.
progressively disappear. In absence of such rules, these markets would be, like other sectors of the economy, subject to the discipline imposed by competition rules. There is no doubt that this approach could and probably should be replicated to other network industries, but the level of competition in these sectors is probably insufficient to justify such a deregulatory effort.

Moreover, even in the electronic communications field, it is unlikely that sector-specific regulation will soon, if ever, completely disappear. First, the local loop still holds natural monopoly features and until wireless technologies are able to entirely replace the telephone network, it will still have to be regulated. In addition, regulation will remain necessary to maintain a reasonable level of universal service. In the absence of regulation, universal service would not be provided spontaneously by market forces as it entails providing services to unprofitable customers or in loss-making areas. The same remark can be made for the other network industries. Universal service could thus remain the last bastion of regulation.

One has thus to expect a progressive reduction of the level of sector-specific regulation, which is currently observed and an increasing reliance on competition rules to prevent incumbents to abuse from their market power. It is, however, unlikely that sector-specific regulation will entirely disappear.

7 CONCLUSION

Liberalization has largely been a successful process, which should be led to completion. Lower prices, higher quality, greater innovation, and more customer-friendliness are some of the main achievements of this process, although of course exceptions can be identified on some markets. The challenge at this stage is no longer whether liberalization should take place. It is to ensure that EU citizens will be able to enjoy the benefits of competitive markets.

The EU institutions and the Member States should thus seek to remove the various bottlenecks identified above, which still impede the development of competitive markets. While the European Commission has the power to initiate proposals for new legislation, the ball is essentially in the hands of the Member States. Faster and better implementation of EU directives, the putting into place of independent and well-resourced regulators, investments in network infrastructures, and the absence of protectionist policies are principles/actions that should significantly contribute to the development of competitive network industries markets.
